

# Module Multifile

## Module for BIM Vision

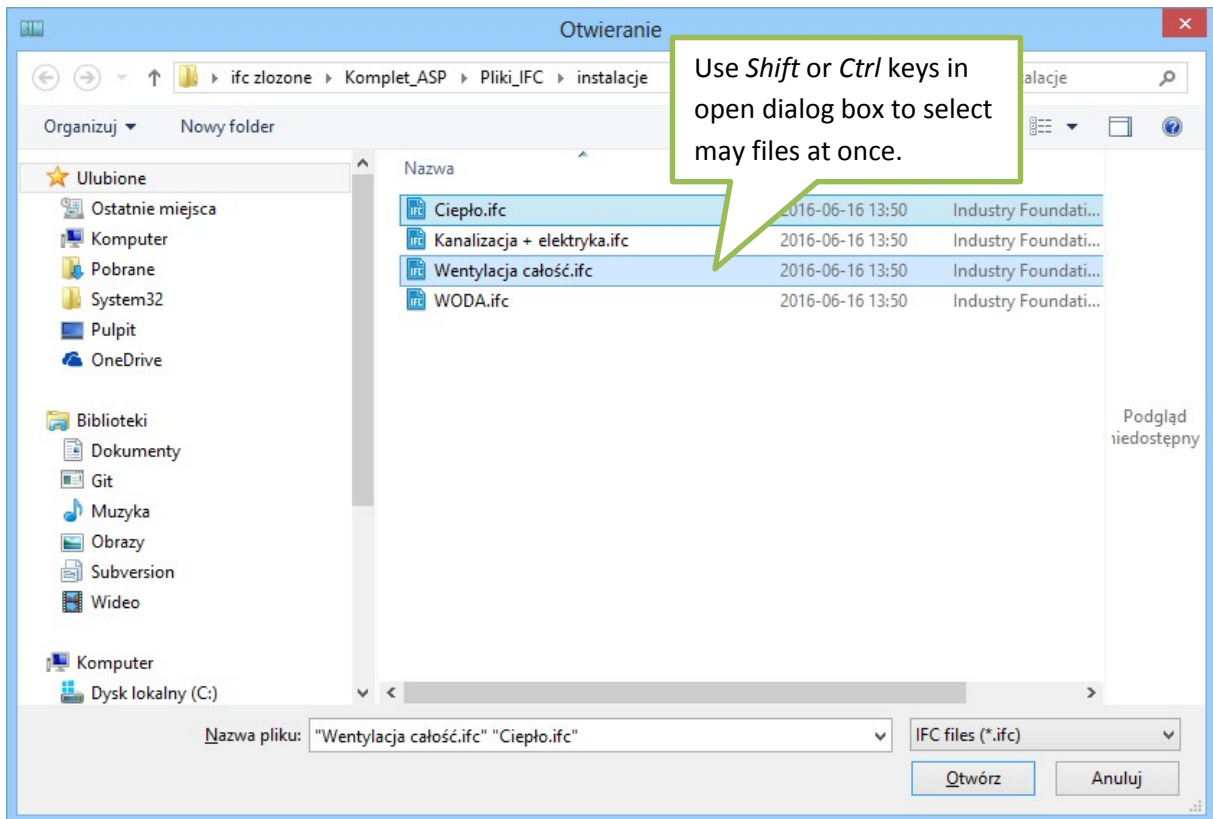

This BIM Vision module allows to load and view multiple IFC files in one view. IFC files can have different scales and units, but should be drawn in same coordinate system (same centre). All added files will be rescaled to first opened file.

## User interface

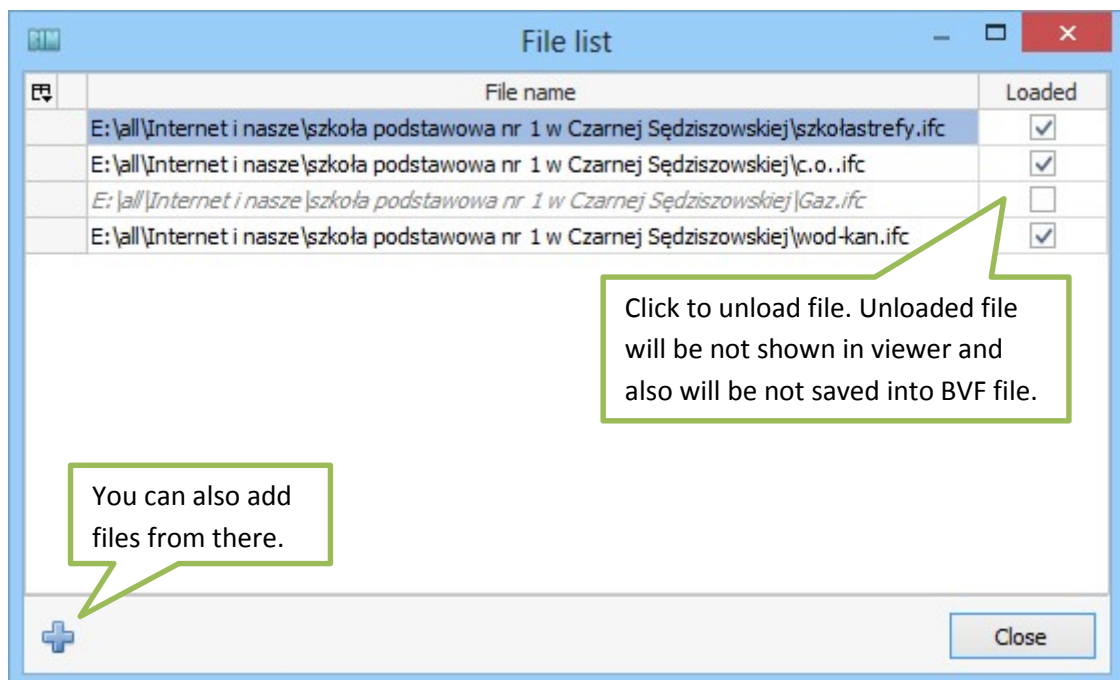

Module adds two new buttons in BIM Vision main menu. These buttons are active and can be used only when an IFC file is already opened.

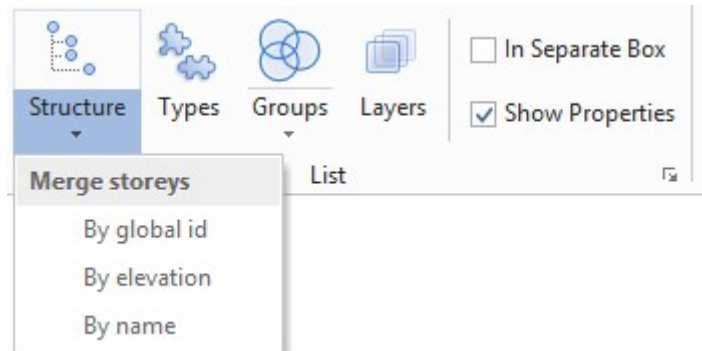

## Open dialog box

## File list window

When two or more files are loaded, module adds new option for IFC Structure object list – merge storeys.

## Demo limitations

Demo allows to load only two IFC files in one view, and has no opened files list.

## Release Notes

- ability to unload projects
- you can now merge storeys also by name and elevation

## Contact and copyrights
